EXECUTIVE SUMMARY

Stormwater Treatment Area 1 West (STA-1W) is a constructed wetland that is part of the Everglades Construction Project mandated by Florida's Everglades Forever Act (Section 373.4592, Florida Statutes [F.S.]). STA-1W was built as an expansion of the Everglades Nutrient Removal (ENR) Project, a constructed wetland to demonstrate the effectiveness of phosphorus (P) removal from agricultural runoff/drainage. The ENR was operated for five years (1994 to 1999) and STA-1W started operation on July 1, 1999. STA-1W covers 2,700 hectares (ha) (6,670 acres [ac]) and is located in south Florida (26° 38' N, 80° 25' W) at the eastern edge of the Everglades Agricultural Area (EAA). The EAA with approximate area of 223,855 ha (552,922 ac) under agriculture (Redfield et al., 1999), is a highly productive irrigation drainage basin with a major production of sugarcane. Ecological changes in the Everglades have been partially attributed to an increase in P concentrations in the inflow waters. Local, state and federal initiatives have been taken to reduce P loads from agricultural runoff/drainage. Water from the agricultural area flows to the south and southeast through four primary canals: Miami, North New River, Hillsboro, and West Palm Beach. The West Palm Beach canal which carries runoff/drainage from the agricultural area and Lake Okeechobee releases is the inflow source for STA-1W.

A minimum of 25 percent of the P load from the EAA is required to be removed at the basin level through the application of various agricultural Best Management Practices (BMPs) (Whalen and Whalen, 1994). Further removal of P is to be achieved through constructed wetland systems, known as Stormwater Treatment Areas (STAs), to an initial outflow total P concentration of 0.05 milligrams per liter (mg L^{-1}). STA-1W is one of the large-scale constructed wetlands that followed the successful operation of the ENR Project. This report presents the fourth annual water budget for STA-1W. Water budget analyses for five years of the ENR Project and three years of STA-1W were reported in the South Florida Water Management District's (SFWMD's) technical publications (Guardo et al., 1996; Abtew and Mullen, 1997; Abtew and Downey, 1998; Abtew et al., 2000; Abtew et al., 2001; Abtew et al., 2002).

The total inflow into STA-1W through the inflow spillway for the study period was 73,006 hectare-meters (ha-m) (591,845 acre-feet [ac-ft]), and the total outflow through the outflow pumps was 73,518 ha-m (595,996 ac-ft). Estimated seepage inflow from the L-7 levee through the roadside culverts was 396 ha-m (3,210 ac-ft). The seepage recirculation pump had a total flow of 1,431 ha-m (11,601 ac-ft). The areal average rainfall for the study period was 107.4 centimeters (cm), or 42.3 inches (in), and the total areal average evapotranspiration (ET) was 129.7 cm (51.1 in). A comparison with the previous three years of water budget shows that the surface water inflow for this period was the largest which indicates the highest hydraulic loading during this period. The sum of the errors and unknowns (remainders) was 1,378 ha-m which represents 2 percent of the total inflow into the system. Rainfall (4 percent) and ET (5 percent) comprise a small fraction of the current mass balance.

The mean hydraulic loading rate for the study period, based on the daily average inflow, was 7.4 centimeters per day (cm d^{-1}), (2.91 inches per day [in d^{-1}]). The mean hydraulic retention time was 8.2 days and was computed as the ratio of the mean estimated volume of STA-1W and the average of inflow and outflow. The mean estimated volume was computed using the area-weighted (by cell) mean depth of 61 cm (24 in) and total area of 2,700 ha (6,670 ac). The estimated mean hydraulic retention time was the lowest and the hydraulic loading rate was the highest for both the ENR and STA-1W operations.

INTRODUCTION

Background

Stormwater Treatment Area 1 West (STA-1W) is a constructed wetland that is part of the Everglades Construction Project (ECP) mandated by Florida's Everglades Forever Act (EFA) (Section 373.4592, Florida Statutes [F.S.]). STA-1W was built as an expansion of the Everglades Nutrient Removal (ENR) Project, a constructed wetland to demonstrate the effectiveness of phosphorus (P) removal from agricultural runoff/drainage. The ENR operated for five years (1994 to 1999) and STA-1W started operation on July 1, 1999. STA-1W covers 2,700 hectares (ha) (6,670 acres [ac]) and is located in south Florida (26° 38' N, 80° 25' W) at the eastern edge of the Everglades Agricultural Area (EAA). The EAA is approximately a 223,855 ha (552,922 ac) (Redfield et al., 1999), highly productive irrigation drainage basin with a major production of sugarcane. Ecological changes in the Everglades have been partially attributed to an increase in P concentrations in the inflow waters. Local, state and federal initiatives have been taken to reduce P loads from agricultural runoff/drainage. Water from the agricultural area flows to the south and southeast through four primary canals: Miami, North New River, Hillsboro and West Palm Beach.

A minimum of 25 percent of the P load from the EAA is required to be removed at the basin level through the application of various agricultural Best Management Practices (BMPs) (Whalen and Whalen, 1994). Further removal of P is to be achieved through constructed wetland systems, known as Stormwater Treatment Areas (STAs), to an initial outflow total P concentration of 0.05 milligrams per liter (mg L^{-1}). STA-1W is one of the large-scale constructed wetlands that followed the successful operation of ENR Project. This report presents the fourth annual water budget for STA-1W (May 1, 2002 to April 30, 2003). Water budget analyses for five years of the ENR Project and three years of STA-1W were reported in the South Florida Water Management District's (SFWMD's) technical publications (Guardo et al., 1996; Abteu and Mullen, 1997; Abteu and Downey, 1998; Abteu et al., 2000; Abteu et al., 2001; Abteu et al., 2002).

Site Description

A survey of the ENR Project indicated that the area is primarily covered by Okeechobee muck soils where one to two meters of peat overlies several meters of carbonate rock (Jammal and Associates, Inc., 1991). The topography of STA-1W is relatively flat, with an average elevation of 2.99 meters (m) (9.8 feet [ft]) National Geodetic Vertical Datum (NGVD). To the east, the L-7 levee separates STA-1W from the Arthur R. Marshall Loxahatchee National Wildlife Refuge (Water Conservation Area 1 [WCA-1]). The seepage canal runs along the northern perimeter and the discharge canal on the west separates STA-1W from agricultural land. The narrow southern ENR levee separates STA-1W from the discharge area into WCA-1. STA-1W consists of five cells: cells 1, 2, 3, 4 and 5. Cells 1 and 3, and cells 2 and 4 (in series) comprise two parallel treatment trains of cells incorporated from the previous ENR. As shown in Figure 2, the largest cell, Cell 5, has been added to the north and operates parallel to the other cells. The total area of STA-1W is 2,700 ha (6,670 ac). The area and average ground elevation for each cell are presented in Table 1.

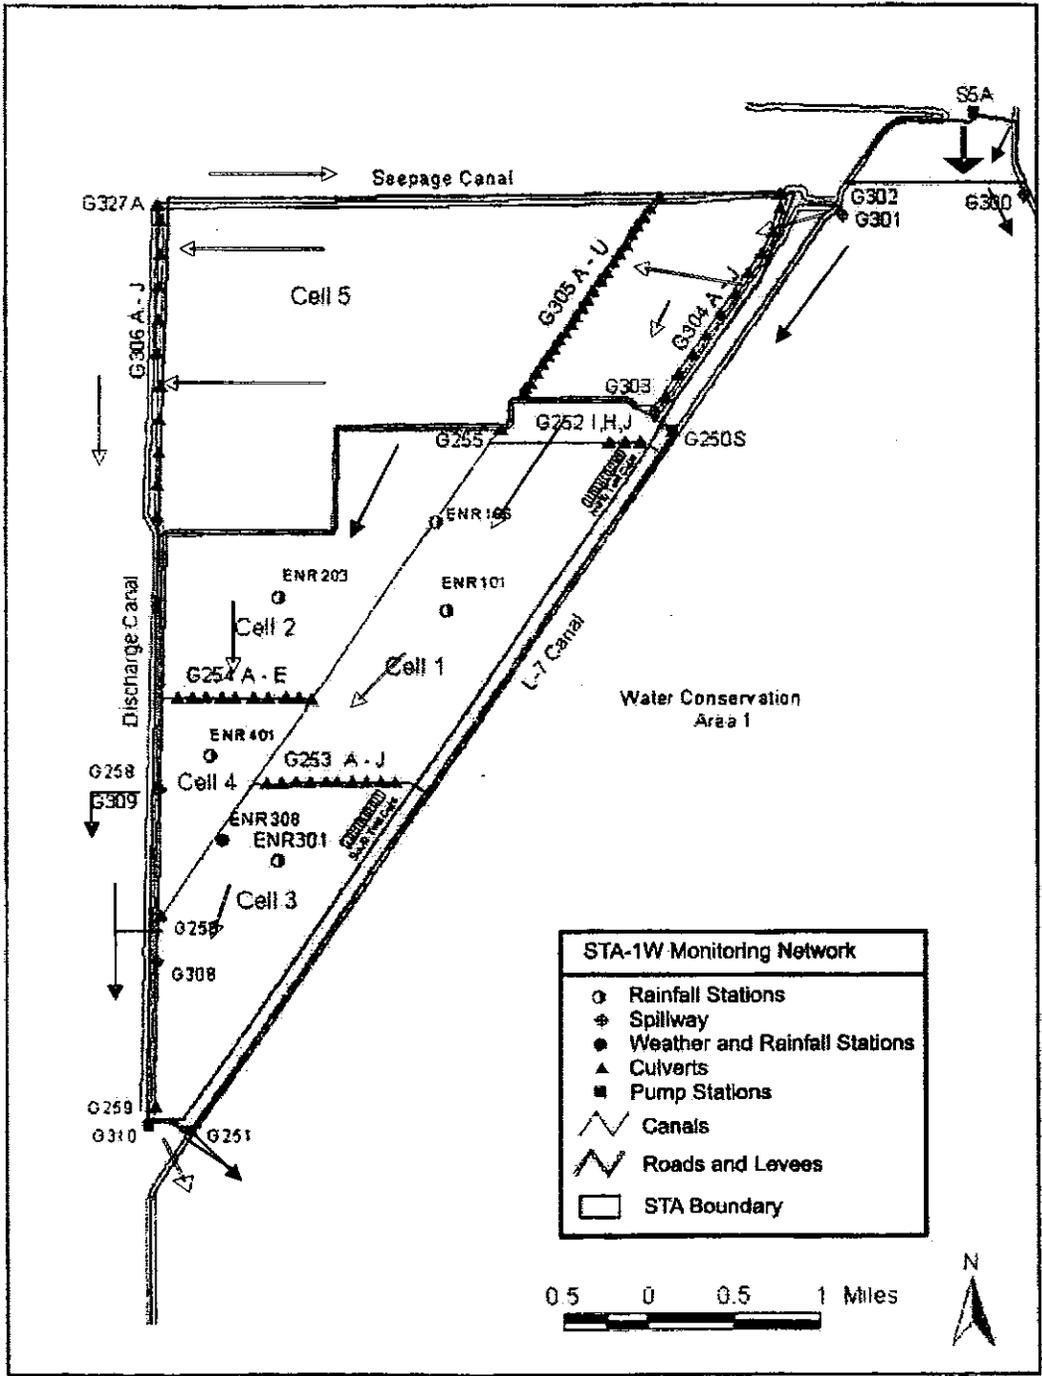

Figure 2. STA-1W structures and monitoring network

Vegetation Cover

At STA-1W, vegetation cover generally varies from cell to cell and coverage changes with time. Cell 1 is covered mostly with emergent vegetation dominated by cattail (*Typha* spp.), but the Cell 1 also contains significant coverage of submerged aquatic vegetation (SAV). A portion of Cell 1 contains the floating aquatics water hyacinth (*Eichhorina crassipes*) and water lettuce (*Pistia stratiotes*) as well as leather fern (*Acrostichum* sp.), carolina willow (*Salix caroliniana*) and primrose willow (*Ludwigia* sp.). Cell 2 is mostly covered with floating islands that contain leather fern, carolina willow, primrose willow and cattail, but this cell also contains significant coverage of SAV and periphyton. Cell 2 contains the floating aquatics water hyacinth and water lettuce. Cell 3 is mostly covered with emergent vegetation dominated by cattail, but also contains significant coverage of pickerelweed (*Pontederia cordata*), arrowhead (*Sagittaria latifolia*), duck potato (*Sagittaria lancifolia*), spikerush (*Eleocharis* sp.) and carolina willow. Cell 4 is covered with SAV dominated by southern naiad (*Najas guadalupensis*), coontail (*Ceratophyllum demersum*), and pondweed (*Potamogeton illinoensis*) with naturally occurring periphyton. Cell 5A (eastern) is covered with mixed vegetation containing cattail, southern naiad, the floating aquatics water hyacinth and water lettuce. Cell 5B (western) is covered with submerged aquatic vegetation dominated by southern naiad, coontail and hydrilla (*Hydrilla verticillata*) with naturally occurring periphyton. Also, small amount of cattail and water hyacinth are present in this cell (Neil Larson, SFWMD, personal communication, 2003).

SYSTEM HYDRAULICS AND OPERATION

System Hydraulics

STA-1W Inflow and Distribution

Water from West Palm Beach canal (C-51) that previously was pumped into the Refuge (WCA-1) via the S5A pump station and flowed through the Refuge is presently diverted to STA-1W. A small portion of the area of WCA-1 near the S5A pump station is levied and forms the STA-1W inflow and distribution (STA-1 Inflow Basin) that serves as a storage area to divert water into STA-1W and into STA-1E (upon completion). There are two former and four new water control structures in the STA-1 I&D. The S5A pump station delivers water from C-51 (West Palm Beach Canal); the S5AS spillway controls WCA-1 inflow and outflow at the junction of L-8 and C-51. The junction has culvert structures S5AW and S5AE. The four new spillway structures are G300, G301, G302 and G311.

G300 is a two-bay, reinforced concrete, U-shaped spillway with vertical lift gates installed on the crest of ogee-shaped weirs. The purpose of this structure is to bypass flows from the STA-1 Inflow Basin area into the L-40 borrow canal that runs along the eastern edges of WCA-1. G301 is a three-bay, reinforced concrete, U-shaped spillway with vertical lift gates on weirs. The purpose of this structure is to bypass flow from the STA-1 Inflow Basin area into WCA-1 along the L-7 borrow canal on the western edge of WCA-1. G302 is a fixed-crest, concrete ogee spillway equipped with two vertical lift gates each of which are 6 m (20 ft) wide. The purpose of this structure is to supply inflow to the five cells of STA-1W from the STA-1 Inflow Basin area. G302 has a capacity of 92 cubic meters per second ($\text{m}^3 \text{s}^{-1}$) (3,250 cubic feet per second [cfs]). G311 is designed as a three-bay, reinforced concrete spillway with lift gates on weirs. The purpose of this structure is to supply water from the STA-1 Inflow Basin area to STA-1E which is currently under construction. It can also transfer water from STA 1-E to STA 1-W via the inflow basin when needed. Structure information for the STA-1W stations is provided in Table 2. Structure locations are shown in Figure 2.

STA-1W Inflow, Internal, and Discharge Structures

The supply canal to STA-1W is about 2.72 kilometers (km) (1.7 miles [mi]) long, extending between the inflow structure G302 and the flow-control structures into cells 1, 3, 2 and 4 (G303). The canal has a side slope of 2.5:1, with a bottom width of 18.3 m (60 ft) at elevation -1.52 m (-5 ft) NGVD. Expected velocities in the inflow canal vary between 0.232 m s^{-1} (0.76 ft s^{-1}) and 0.418 m s^{-1} (1.37 ft s^{-1}) (Hutcheon Engineers, 1996). G303 is a two bay ogee spillway equipped with two lift gates with each 4.9 m (16 ft) wide and with a discharge capacity of $50.4 \text{ m}^3 \text{ s}^{-1}$ (1780 cfs).

The perimeter and inter-cell levees facilitate vehicle transportation within the wetland. There are culverts situated below the levees for inflows, outflows, and inter-cell water delivery. Under each levee, the culverts are spread along the levee to facilitate distribution of flow over the downstream cell area. The evenness of flow distribution depends on the ground surface elevations and vegetation cover of the receiving cell.

Upstream of cells 1 and 2, there was initially a buffer cell that received flow from G250S (seepage return pumps) and the inflow spillway G303. Also, there was a levee with 10 culverts (G252A-J) between the Buffer Cell and Cell 1. However, the transition to STA-1W involved degrading about 70 percent of the levee and removing all but three of the culverts (G252H, I, and J). The number of culverts between the buffer cell and Cell 2 originally was five (G255A through E) but the number was increased to seven (G255A-G) during the transition from ENR to STA-1W which made a direct connection between Cell 1 and 2. Similarly, there were initially five G254 culverts between cells 2 and 4 under the ENR Project, but they were increased to nine as part of STA-1W (G254A, A1, B, B1, C, C1, D, D1 and E). The levee between cells 1 and 3 has 10 culverts G253 (A through J), which did not change during the transition from ENR to STA-1W. Between cells 4 and 3 there are five culverts (G256A through E), which were not affected by the transition from ENR to STA-1W.

The inflow to Cell 5 occurs through ten corrugated metal pipe culverts which are 29.3 m (96 ft) long (G304A through J). The combined capacity of the inflow culverts (G304A through J) is $41.6 \text{ m}^3 \text{ s}^{-1}$ (1,470 cfs). The Florida Power and Light (FPL) levee runs across Cell 5 dividing the cell into two parts. Twenty-two culverts (G305A through V) were constructed to deliver water from the eastern part to the western part of the cell. Each of the G305 culverts is 213 cm (84 inches) in diameter and 27.4 m (90 ft) long, with an invert elevation of 1.07 m (3.5 ft) NGVD. Seepage and recirculated water from the discharge canal is pumped through G250S to Cell 1 through the former ENR Buffer Cell, which is now part of Cell 1. G250S has three main pumps with a combined capacity of $5.66 \text{ m}^3 \text{ s}^{-1}$ (200 cfs), and three supplemental pumps from the old ENR inflow pump station G250 with a combined capacity of $8.49 \text{ m}^3 \text{ s}^{-1}$ (300 cfs).

At the west end of Cell 3 there are two outflow structures releasing to the discharge canal, G308 and G259. Similarly, G258 and G309 are the two outflow structures releasing to the discharge canal from Cell 4, located at the west end. Hydraulic information for internal structures is shown in Table 3.

The outflow from Cell 5 to the discharge canal occurs through ten corrugated metal pipe culverts which are 183 cm (72 in) in diameter and 39.6 m (130 ft) long have a combined discharge capacity of $41.6 \text{ m}^3 \text{ s}^{-1}$ (1,470 cfs). G327A is a gated culvert which is 213 cm (84 in) in diameter, and 39.6 m (130 ft) long with $2.83 \text{ m}^3 \text{ s}^{-1}$ (100 cfs) discharge capacity. G327C is a culvert 39.3 m (129 ft) long and has a discharge capacity of $2.83 \text{ m}^3 \text{ s}^{-1}$ (100 cfs).

The discharge from Cell 1 into Cell 3 flows through ten culverts which are 183 cm (72 in) diameter and 17.7 m (58 ft) long (G253A through J). Discharge from Cell 2 into Cell 4 flows through nine culverts (G252A, A1, B, B1, C, C1, D, D1, and E) which are 183 cm (72 in) diameter and 16.5 m (54 ft) long. Discharge from Cell 3 is to the discharge canal through G308 and G259 and to WCA-1 through the G251 pump station. G308 is a gated weir with a discharge capacity of $15.85 \text{ m}^3 \text{ s}^{-1}$ (560 cfs). G259 is a gated culvert which is 183 cm (72 in) in diameter and 23.9 m (78.5 ft) long. Discharge from Cell 4 is into the discharge canal through G309, G258 and into Cell 3 through G256A through E. G309 is a gated weir with a discharge capacity of $15.85 \text{ m}^3 \text{ s}^{-1}$ (560 cfs). G258 is a gated culvert which is 183 cm (72 in) in diameter and 23.5 m (77 ft) long. G256A-E consists of five culverts which are 183 cm (72 in) in diameter and 16.6 m (54.5 ft) long. The STA-1W outflow structures are composed of the G251 and G310 pump stations. G251 has six identical pumps with a combined capacity of $12.74 \text{ m}^3 \text{ s}^{-1}$ (450 cfs). G310 is equipped with six pumps of three different capacities, with a total capacity of $86 \text{ m}^3 \text{ s}^{-1}$ (3,040 cfs). G310 has two electric pumps with a combined discharge capacity of $5.66 \text{ m}^3 \text{ s}^{-1}$ (200 cfs), two diesel pumps, with a combined discharge capacity of $26.6 \text{ m}^3 \text{ s}^{-1}$ (940 cfs), and two diesel pumps with a combined discharge capacity of $53.8 \text{ m}^3 \text{ s}^{-1}$ (1,900 cfs).

The discharge canal extends between G327A at the northwest corner and the G310 pump station at the southwestern corner. The discharge canal is about 9.12 km (5.7 mi) long with bottom width varying from 15.2 m (50 ft) at G327A to 24.4 m (80 ft) at G308 and to 30.5 m (100 ft) at G259, to account for changes in flow magnitude and ground elevation.

Operation

S5A diverts water from the West Palm Beach canal into the STA-1 Inflow Basin area. From the STA-1 I&D area, water flows to STA-1W through spillway G302 or is bypassed to WCA-1 through G300 and G301 when the need arises. Water flows into Cell 5 via inflow canal and through culverts G304 A through J, and into treatment cells 1, 2, 3 and 4 through the gated weir structure G303. The old ENR seepage pumps (G250S) control stages in the seepage canal north of treatment Cell 5 and redirect flow to the former ENR (cells 1, 2, 3 and 4). Culverts, installed beneath G302, deliver seepage return inflow to the G250S pumps. In return, the pumps convey the seepage return flow into Cell 1 that also receives inflow from G303 as well. Thus, flow is primarily direct surface flow and partly through the remaining culverts G252 (H, I, and J). Cell 2 receives flow from Cell 1 through culverts G255 (A through G). Water flows from Cell 1 to Cell 3 through culverts G253 (A through J). Water delivery between cells 2 and 4 occurs through nine culverts G254 (A, A1, B, B1, C, C1, D, D1, and E). At the west end of Cell 3 there are two outflow structures releasing to the discharge canal, G309 spillway and G258 culvert. Similarly, G308 spillway and G259 culvert are the two outflow structures releasing to the discharge canal from Cell 4, located at the west end. Water delivery from Cell 4 to 3 is through culverts G256A through E as was during the former ENR project. Outflow from STA-1W is through pump stations G251 lifting water from Cell 3 to WCA 1 and G310 lifting water from the discharge canal to WCA 1.

HYDROLOGY AND HYDROLOGIC MONITORING

Rainfall

STA-1W has a six-gage rainfall monitoring network. The rainfall gauging stations along with their corresponding database keys and Thiessen weights are presented in Table 4. The gage locations are depicted in Figure 2. The areal average rainfall on the project site was computed using a Thiessen-weighted average of the six-gage network. Minimal data gaps at a station are estimated, while extended gaps result in areal rainfall computation using remaining stations with a new set of Thiessen weights. The daily distribution of areal average rainfall for the study period is depicted in Figure 3. The monthly summary of areal average rainfall for STA-1W is shown in Table 5. The 12-month total areal average rainfall for STA-1W was 107.4 cm (42.3 in). The eight year (July 1, 1994 to June 30, 2002) average areal rainfall for the previous ENR constructed wetland and the current STA-1W was 136.4 cm (53.5 inches).

Table 4. Rainfall stations in STA-1W, database retrieval keys and Thiessen weights

Stations	DBKEY	Theissen Weights
ENR101	15851	0.087
ENR106	DU515	0.441
ENR203	15874	0.222
ENR301	15877	0.126
ENR308	15888	0.049
ENR401	15862	0.075

Evapotranspiration

The daily evapotranspiration (ET) was computed from high-resolution weather data using a radiation-based ET estimation model that was developed based on lysimeter studies in the ENR (Abteu, 1996a; 1996b). A complete weather station is located in Cell 3 (ENR 308). The daily distribution of ET for STA-1W for the study period is depicted in Figure 3. Monthly summary of ET for STA-1W is shown in Table 5. The 12-month total areal ET for STA-1W was 129.7 cm (51.1 in). The seven-year (July 1, 1995 to Jun 30, 2002) average areal ET for the previous ENR and current STA-1W was 133.3 cm (52.5 in).

“1 ha-m = 8.1068 ac-ft”

Flows

Database keys for STA-1W flow structures and stage gages are listed in Table 6. The total inflow spillway discharge for the study period was 73,006 ha-m (591,845 ac-ft), and the total outflow through the outflow pump stations was 73,518 ha-m (595,996 ac-ft). In the past, inflows through G302 were underestimated. In July 2003, new flow data for the period of record was loaded to the database after recalibration of the flow computation equations for G302 spillway. The daily discharge rates of the inflow spillway and outflow pumps are shown in Figure 4. The estimated seepage from L-7 levee flowing through the roadside culverts and the daily seepage recycling pumping is presented in Figure 5. The total seepage and recirculation pumping was 1,431 ha-m (11,601 ac-ft). The L-7 seepage through the roadside culverts was estimated using a regression equation developed from 42 data points. Guardo (1996) developed relationship between the seepage from L-7 through the roadside culverts, the stage rise in WCA-1 above 4.57 m (15 ft) NGVD, and the difference in stages between WCA-1 and the eastern cells of the ENR (Equation 1). The regression had a coefficient of determination (R^2) of 0.93 and a standard error of $0.30 \text{ m}^3 \text{ s}^{-1}$. The total estimated seepage from L-7 through roadside culverts was 396 ha-m (3,210 ac-ft). The monthly flow data for the study period are presented in Table 5.

$$L7a = 0.217 * \Delta WCA^{1.311} * \Delta h^{2.025} \quad (1)$$

Where L-7a is seepage in $\text{m}^3 \text{ s}^{-1}$, ΔWCA is rise in stage in WCA-1 above 4.57 m (15 ft) NGVD and Δh is the difference in stage between WCA-1 and the eastern cells of STA-1W.

Water Levels

Daily water levels or water surface elevations (stages) in each cell of STA-1W are dependent upon rainfall, evapotranspiration, seepage and daily operational decisions. Water levels have been regulated based on water depth, operation status of the S5A pump station, tests, maintenance and other operational decisions. The minimum, maximum and mean of the daily average stage observations for the study period are shown in Table 7. The mean observed stage in Cell 1 was 3.79 m (12.44 ft) NGVD. The mean stage in Cell 2 was 3.73 m (12.25 ft) and the mean stage in Cell 3 was 3.65 m (11.98 ft). The mean stage in Cell 4 was 3.68 m (12.06 ft) NGVD, and the mean stage in Cell 5 was 3.42 m (11.22 ft) NGVD. The average daily stages for Cell 5 were computed from the stage readings for G304 tailwater and G306 headwater. The average daily water level observations in Cell 1 and 3 of STA-1W and WCA-1 are shown in Figure 6. Water levels for cells 2 and 4 are shown in Figure 7 and the daily water levels for Cell 5 are shown in Figure 8. The mean water depths for cells 1, 2, 3, 4 and 5 were 66 cm (26.1 in), 79 cm (31.3 in), 55 cm (21.7 in), 68 cm (26.6 in) and 52 cm (20.5 in) respectively.

WATER BUDGET COMPUTATIONS

STA-1W Water Balance Model

A schematic hydrologic model for STA-1W is depicted in Figure 9. The inflow supplied through the G302 spillway accounts for about 94% of the inflow to the system. The known inflows to the system are G302 spillway inflows, rainfall and seepage through the roadside L-7 levee culverts (L-7a). Rainfall accounts for 4%, and seepage through the roadside culverts (L-7a) accounts for 1%. Outflow pumping (G251 and G310) accounts for 95% of the outflows, with evapotranspiration constituting 5% of the total outflows. The unknowns in the system are ungauged subsurface inflows, outflows and errors that account for 2% of the total inflows. The schematic model (Figure 9) and the following set of water balance equations represent the hydrologic system of STA-1W for water budget analysis purposes.

$$\text{INFLOW} - \text{OUTFLOW} = \Delta S + \epsilon_T \quad (2)$$

Where INFLOW is the amount of water that enters the system from external sources, and OUTFLOW is water that leaves the system boundary and is not recirculated. ΔS is the change in storage in the system during the time interval of interest. The sum of all errors is represented by ϵ_T . Because all inflows and outflow cannot be entirely quantified, the following equation is introduced to represent the remainders, errors and unknowns:

$$\text{REMAINDERS} = \epsilon_T + \text{UNKNOWN} \quad (3)$$

Figure 9 shows the possible inflows and outflows to and from the STA-1W system. The seepage canal, which encompasses the northern side of STA-1W, is designed to capture seepage from STA-1W to the neighboring area and to recirculate discharge from the discharge canal when needed. Seepage through the former ENR supply canal is represented as SEEP1, and seepage in and out of the seepage canal to the north is represented as SEEP2. SEEP3 represents the two seepage possibilities into or out of the discharge canal to the west, regardless of the magnitude. SEEP4 represents the possible seepage loss or gain through the southern levee from WCA-1. The unmeasured inflow from WCA-1 into STA-1W from the east is represented by L-7b.

In computing the water balance for STA-1W, it is essential to identify quantifiable variables from unquantifiable variables, making reasonable assumptions to reduce the quantity of unknowns as much as possible. Since the purpose of the seepage canal is to recirculate seepage and recycle water, it is assumed that the seepage return pump flows are recirculation in the system. This assumption does not rule out the possibility of external seepage inflow being part of recirculation flow or seepage loss out of the seepage canal. The change in storage is represented as follows:

$$\Delta S = G302 + R + L7a + L7b - G251 - G310 - ET + SEEP1 + SEEP2 + SEEP3 + SEEP4 + \epsilon_T \quad (4)$$

Where ΔS is change in storage in the system; G302 is inflow; R is rainfall; L-7a is seepage flow from WCA-1 through the roadside culverts; L-7b is unknown subsurface seepage flow from WCA-1 into STA-

1W; ET is evapotranspiration losses. G310 and G251 represent outflow pumping; ϵ_T represents total error in inflow and outflow terms.

The daily change in storage for STA-1W was computed as the sum of storage changes in each of the five cells (cells 1, 2, 3, 4, and 5). The change in storage volume in each cell was computed based on the area of the cell and change in stage in the cell. The remainders in the computation of daily water balances are the sum of all errors and unknowns in the system. Daily remainders were computed for the one-year study period based on the following equation:

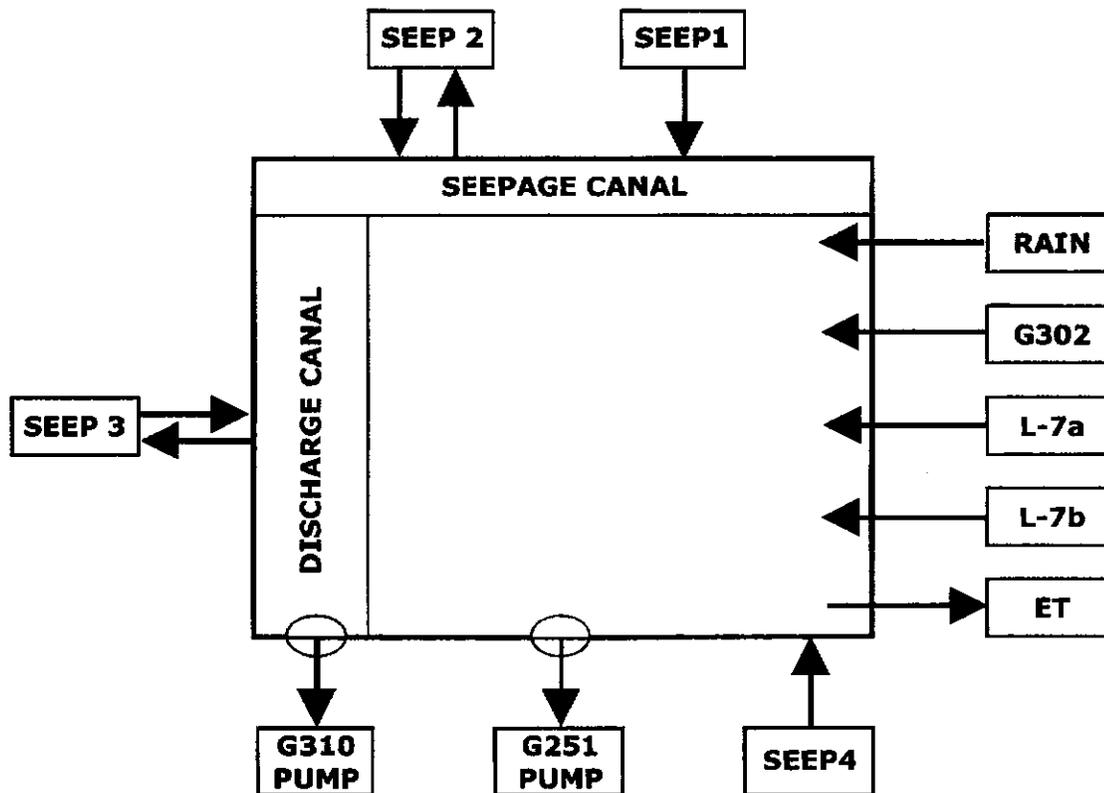

Figure 9. Schematic hydrologic model for STA 1-W

$$\text{REMAINDERS} = \Delta S - \text{INFLOWS} + \text{OUTFLOWS} \quad (5)$$

Discussion

The total inflow through the inflow spillway was 73,006 ha-m (591,845 ac-ft) and total outflow through the outflow pumps was 73,518 ha-m (595,996 ac-ft). Seepage inflow from L-7 levee through the roadside culverts was a total of 396 ha-m (3,210 ac-ft). The seepage and recirculation pump had a total flow of 1,431 ha-m (11,601 ac-ft). Total average areal rainfall for the study period was 107.4 cm (42.3 inches) and the total average areal evapotranspiration was 129.7 cm (51.1 inches). For the study period, the mean daily remainders (errors and unknowns) was 3.78 ha-m d⁻¹ (30.6 ac-ft d⁻¹), with total remainder being 1,378 ha-m d⁻¹ (11,171 ac-ft d⁻¹). The standard deviation of the remainders is 92.1 ha-m d⁻¹ (746.6 ac-ft d⁻¹), which signifies high variation. Figure 10 depicts the daily remainder distribution. The remainder is 2 percent of the total inflows. The known outflow from the system is higher than the known inflow and the remainder is accounted as inflow.

A summary of the one-year water budget is shown in Table 8. Details of the daily water balances terms and calculations results are shown in Appendix I. The mean hydraulic loading rate for the study period, based on the average inflow, was 7.4 centimeters per day (cm d⁻¹), or 2.91 inches per day (in d⁻¹). The mean retention time was computed as the ratio of the mean estimated water volume of STA-1W and the average daily flow rate, inflow and outflow. The estimated mean volume was computed from the area-weighted (by cell) mean depth of 61 cm (24 inches) and a total area of 2,700 ha (6,670 ac). The estimated mean hydraulic retention time was 8.2 days.

Retention time (days)	8.2

"1 ha-m = 8.1068 ac-ft"

WATER BUDGET SUMMARY

This water budget study covers the fourth year of operation of STA-1W. The period of analysis was changed to May of previous year to April of current year in order to coincide with the reporting period for the Everglades Consolidated Report. For the period of analysis, the total inflow through the spillway (G302) was 73,006 ha-m, or 591,845 ac-ft. The total outflow through the outflow pump stations (G251 and G310) was 73,518 ha-m (595,996 ac-ft). Seepage inflow from L-7 levee through the roadside culverts was 396 ha-m (3,210 ac-ft). The seepage and recirculation pump had a total flow of 1,431 ha-m (11,601 ac-ft). Total areal average rainfall for the study period was 107.4 cm (42.3 in), and the total areal average evapotranspiration was 129.7 cm (51.1 in). The sum of the errors and unknowns was 1,378 ha-m (11,171 ac-ft), which represents 2 % of the total inflows to the system.

The mean hydraulic loading rate for the one-year period, based on the average flow, was 7.2 cm d⁻¹ (2.83 in d⁻¹). The mean hydraulic retention time was computed as the ratio of the estimated mean volume of STA-1W and the average daily flow rate. The estimated mean volume was computed using the area-weighted (by cell) mean depth of 61 cm (24 inches) and a total area of 2,700 ha (6,670 ac). The estimated mean hydraulic retention time was 8.2 days and the change in storage was 645 ha-m (5,229 ac-ft). A comparison with the previous three years of water budget shows that surface water inflow and outflow for this period was the largest indicating highest hydraulic loading and smallest hydraulic retention time.

Inflow through the G302 spillway that was used for the previous three water budgets for STA-1W was underestimated by the flow computation equations. In July 2003, after recalibration of the flow equations, new flow data for the G302 spillway, was loaded into the database for the period of record. Comparison of previous years' and current year water budgets are shown in Table 9. Inflows into STA-1W through the G302 spillway were updated based on the new dataset in DBHYDRO.
